

Class-IX Math SOLVED CBSE TEST PAPER - 02

Chapter: Area of Parallelogram and Triangles

**1. If E, F, G and H are respectively the mid-points of the sides of a parallelogram ABCD**

**show that  $\text{ar}(\text{EFGH}) = \frac{1}{2} \text{ar}(\text{ABCD})$**

In parallelogram ABCD,

$AD \parallel BC$

$\Rightarrow AH \parallel BF$

and  $AD = BC$

$\Rightarrow \frac{1}{2} AD = \frac{1}{2} BC$

$\Rightarrow AH = BF$

Therefore, ABFH is a parallelogram.

$\Rightarrow AB \parallel HF$

Since  $\triangle HEF$  and parallelogram ABFH are on the same base HF and between the same parallel lines AB and HF,

$\therefore \text{ar}(\triangle HEF) = \frac{1}{2} \text{ar}(\text{ABFH})$  -----(i)

Similarly, it can be proved that

$\text{ar}(\triangle HGF) = \frac{1}{2} \text{ar}(\text{HDCF})$  ----- (ii)

On adding equations (1) and (2), we obtain

$\text{ar}(\text{EFGH}) = \frac{1}{2} \text{ar}(\text{ABCD})$

**2. P and Q are any two points lying on the sides DC and AD respectively of a parallelogram ABCD. Show that  $\text{ar}(\triangle APB) = \text{ar}(\triangle BQC)$ .**

$\triangle BQC$  and parallelogram ABCD lie on the same base BC and these are between the same parallel lines AD and BC.

$\therefore \text{ar}(\triangle BQC) = \frac{1}{2} \text{ar}(\text{ABCD})$  ... (1)

Similarly,  $\triangle APB$  and parallelogram ABCD lie on the same base AB and between the same parallel lines AB and DC.

$\therefore \text{ar}(\triangle APB) = \frac{1}{2} \text{ar}(\text{ABCD})$  ... (2)

From equation (1) and (2), we obtain

$\text{ar}(\triangle BQC) = \text{ar}(\triangle APB)$

**3. In the given figure, P is a point in the interior of a parallelogram ABCD. Show that**

**(i)  $\text{ar}(\triangle APB) + \text{ar}(\triangle PCD) = \frac{1}{2} \text{ar}(\text{ABCD})$**

**(ii)  $\text{ar}(\triangle APD) + \text{ar}(\triangle PBC) = \text{ar}(\triangle APB) + \text{ar}(\triangle PCD)$**

Let us draw a line segment EF, passing through point P and parallel to line segment AB.

In parallelogram ABCD,

$AB \parallel EF$  (By construction) -----(1)

ABCD is a parallelogram.

$\therefore AD \parallel BC$  (Opposite sides of a parallelogram)

$\Rightarrow AE \parallel BF$  ----- (2)

From equations (1) and (2),

$AB \parallel EF$  and  $AE \parallel BF$

Therefore, quadrilateral ABFE is a parallelogram.

Now,  $\triangle APB$  and parallelogram ABFE are lying on the same base AB and between the same parallel lines AB and EF.

$\therefore \text{Area}(\triangle APB) = \frac{1}{2} \text{Area}(\text{ABFE})$  ----- (3)

Similarly,  $\text{Area}(\triangle PCD) = \frac{1}{2} \text{Area}(\text{EFCD})$  -----(4)

Adding equations (3) and (4),

$\text{ar}(\triangle APB) + \text{ar}(\triangle PCD) = \frac{1}{2} \text{ar}(\text{ABCD})$  -----(5)

Similarly by drawing MN, passing through point P and parallel to line segment AD. we can prove that

$\text{ar}(\triangle APD) + \text{ar}(\triangle PBC) = \frac{1}{2} \text{ar}(\text{ABCD})$  -----(6)

From (5) and (6)

$\text{ar}(\triangle APD) + \text{ar}(\triangle PBC) = \text{ar}(\triangle APB) + \text{ar}(\triangle PCD)$

**4. In the given figure, PQRS and ABRS are parallelograms and X is any point on side BR. Show that (i)  $\text{ar}(\text{PQRS}) = \text{ar}(\text{ABRS})$  (ii)  $\text{ar}(\triangle PXS) = \text{ar}(\triangle QRS)$**

Answer: Parallelogram PQRS and ABRS lie on the same base SR and also, these lie in between the same parallel lines SR and PB.

$\Rightarrow \text{ar}(\text{PQRS}) = \frac{1}{2} \text{ar}(\text{ABRS})$  ... (1)

(ii)  $\Delta AXS$  and parallelogram  $ABRS$  lie on the same base  $AS$  and are between the same parallel lines  $AS$  and  $BR$ ,

$$\therefore \text{Area}(\Delta AXS) = \frac{1}{2} \text{Area}(ABRS) \dots (2)$$

From equations (1) and (2), we obtain

$$\text{Area}(\Delta AXS) = \text{Area}(PQRS)$$

**5. A farmer was having a field in the form of a parallelogram PQRS. She took any point A on RS and joined it to points P and Q. In how many parts the field is divided? What are the shapes of these parts? The farmer wants to sow wheat and pulses in equal portions of the field separately. How should she do it?**

Answer:

From the figure, it can be observed that point A divides the field into three parts. These parts are triangular in shape –  $\Delta PSA$ ,  $\Delta PAQ$ , and  $\Delta QRA$

$$\text{Area of } \Delta PSA + \text{Area of } \Delta PAQ + \text{Area of } \Delta QRA = \text{Area of } PQRS \dots (1)$$

We know that if a parallelogram and a triangle are on the same base and between the same parallels, then the area of the triangle is half the area of the parallelogram.

$$\therefore \text{Area}(\Delta PAQ) = \frac{1}{2} \text{Area}(PQRS) \dots (2)$$

From equations (1) and (2), we obtain

$$\text{Area}(\Delta PSA) + \text{Area}(\Delta QRA) = \frac{1}{2} \text{Area}(PQRS) \dots (3)$$

Clearly, it can be observed that the farmer must sow wheat in triangular part  $PAQ$  and pulses in other two triangular parts  $PSA$  and  $QRA$  or wheat in triangular parts  $PSA$  and  $QRA$  and pulses in triangular parts  $PAQ$ .

**6. Parallelogram ABCD and rectangle ABEF are on the same base AB and have equal areas. Show that the perimeter of the parallelogram is greater than that of the rectangle.**

Solution: Given that  $\parallel gm$  ABCD and rectangle ABEF are on the same base AB and have equal areas.

To Prove: The perimeter of the parallelogram ABCD is greater than that of rectangle ABEF.

Proof: In  $\Delta ADF$ ,  $\angle AFD = 90^\circ$

$\angle ADF$  is an acute angle. ( $< 90^\circ$ )

$$\therefore \angle AFD > \angle ADF$$

$\Rightarrow AD > AF$  (Side opposite to greater angle of a triangle is longer)

Adding side AB on both side

$$\Rightarrow AB + AD > AB + AF \Rightarrow 2(AB + AD) > 2(AB + AF)$$

**7. In figure, ABCD is a parallelogram and BC is produced to a point Q such that  $AD = CQ$ . If AQ intersects DC at P, Show that  $ar(\Delta BPC) = ar(\Delta DPQ)$ .**

Given: ABCD is a parallelogram and BC is produced to a point Q such that  $AD = CQ$ . AQ intersects DC at P.

To Prove:  $ar(\Delta BPC) = ar(\Delta DPQ)$ .

Construction: Join AC.

Proof:  $\Delta QAC$  and  $\Delta QDC$  are on the same base QC and between the same parallels AD and QC.

$$\therefore ar(\Delta QAC) = ar(\Delta QDC) \dots (1)$$

$$\Rightarrow ar(\Delta QAC) - ar(\Delta QPC) = ar(\Delta QDC) - ar(\Delta QPC)$$

$$\Rightarrow ar(\Delta PAC) = ar(\Delta QDP) \dots (2)$$

$\therefore \Delta PAC$  and  $\Delta PBC$  are on the same base PC and between the same parallels AB and DC.

$$\therefore ar(\Delta PAC) = ar(\Delta PBC) \dots (3)$$

From (2) and (3),  $ar(\Delta PBC) = ar(\Delta QDP)$

$$\Rightarrow ar(\Delta BPC) = ar(\Delta DPQ).$$

8. P and Q are respectively the mid-points of sides AB and BC of a triangle ABC and R is the mid-point of AP, show that (i)  $ar(PRQ) = ar(ARC)$  (ii)  $ar(RQC) = ar(ABC)$  (iii)  $ar(PBQ) = ar(ARC)$

Solution:

Part- 1

(i)  $ar(PRQ) = \frac{1}{2} ar(APQ)$  ( RQ is median of  $\Delta APQ$ )  
 $\Rightarrow ar(PRQ) = \frac{1}{2} \times \frac{1}{2} ar(ABQ)$  (QP is median of  $\Delta ABQ$ )  
 $\Rightarrow ar(PRQ) = \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} ar(ABC)$  (AQ is median of  $\Delta ABC$ )  
 $\Rightarrow ar(PRQ) = \frac{1}{8} ar(ABC)$  (AQ is median of  $\Delta ABC$ )

Similarly

$$ar(ARC) = \frac{1}{8} ar(ABC)$$

$$\text{Thus, } ar(PRQ) = ar(ARC)$$

Part- 2

$$ar(RQC) = ar(RBQ) = ar(PRQ) + ar(BPQ)$$

$$\Rightarrow ar(RQC) = \frac{1}{8} ar(ABC) + \frac{1}{4} ar(ABC)$$

$$\Rightarrow ar(RQC) = \frac{3}{8} ar(ABC)$$

Part- 03

$$ar(PBQ) = \frac{1}{4} ar(ABC)$$

$$ar(ARC) = \frac{1}{4} ar(ABC)$$

$$\Rightarrow ar(PBQ) = ar(ARC)$$

9. In the figure, ABCD is a rhombus whose side AB is produced to points P and Q such that  $AP = AB = BQ$ . PD and QC are produced to meet at a point R. Show that  $\angle PRQ = 90^\circ$ .

Solution:  $AP = AB$

$$\angle 1 = \angle 3$$

$$CQ = BQ$$

$$\angle 2 = \angle 4$$

$$\text{Now, ext } \angle BAD = \angle 1 + \angle 3 = 2\angle 1$$

$$\text{and ext } \angle ABC = \angle 2 + \angle 4 = 2\angle 2$$

$$\text{adding them, } \angle BAD + \angle ABC = 180^\circ$$

$$2(\angle 1 + \angle 2) = 180^\circ$$

$$\angle 1 + \angle 2 = 180^\circ / 2 = 90^\circ$$

$$\Rightarrow \angle PRQ = 180^\circ - (\angle 1 + \angle 2) = 180^\circ - 90^\circ = 90^\circ$$

10. In triangle PQR, S and T are points on PQ and PR respectively. If  $ar(QSR) = ar(QTR)$ . Show that  $\angle OST = \angle ORQ$

Solution:

$$ar(QSR) = ar(QTR)$$

These are on same base QR and between QR and ST

$$\Rightarrow ST \parallel QR$$

So,  $\angle OST = \angle ORQ$  alternate angles

11. P, Q and R are the mid points of sides BC, AC and AB of  $\Delta ABC$ . If BQ and PR intersect at X and CR and PQ intersect at Y, then show that  $XY = \frac{1}{4} BC$

R and Q are midpoint of AB and AC

$$\Rightarrow RQ = \frac{1}{2} BC \text{ and } RQ \parallel BC$$

$$\Rightarrow RQ = BP \text{ and } RQ = BP$$

So, BPQR is iigm and BQ and RP bisect at X

Similarly PCQR is IIGm and PQ and RC bisect at y

Now, x and y are midpoint of RP and PQ

$$\frac{1}{2} RQ = xy \Rightarrow XY = \frac{1}{4} BC \text{ [} RQ = \frac{1}{2} BC \text{]}$$
